

03- Inserting a Page Icon

INSERTING A PAGE ICON

Note:

The **<link>** element is used in an Html document to tell the browser where to find a particular file.

The **<link>** element is called an **empty element** because it does not need a closing tag.

Before you use an image for your page Icon, you have to convert it to an Icon first.

You can use paint or Photoshop or any software that will do the work done for you.

In the video tutorial, we used paint to convert our image to an Icon.

When saving the image, name it as **favicon.ico**
