

PHP Conditional Statements (if... else if... else)

Conditional Statements are used to perform different actions based on different condition.

When you write code, you want to perform different actions for different conditions.

You can use conditional statements in your code to do this.

In PHP we have the following conditional statement:

- **If Statement:** executes some code if one condition is true.
- **If... else Statement:** executes some code if a condition is TRUE and another code if that condition is FALSE.
- **If... else if... else Statement:** executes different codes for more than two conditions.
- **Switch Statement:** selects one of many blocks of code to be executed. We will learn about **Switch Statement** in our next tutorial.

```
<?php
$time = 23;
if($time < 12){
    echo "Good morning";
}else if($time >=12 && $time <=16){
    echo "Good Afternoon";
}else{
    echo "Good Evening";
}
?>
```

The code above will check the variable **\$time** and execute the conditional statement base on the value of the variable **\$time**.

The code above will echo or print “**Good Evening**” on the screen.
