

The <form> element

The **<input>** element is used to create several different form controls.

The value of the type attribute determines what kind of input they will be creating.

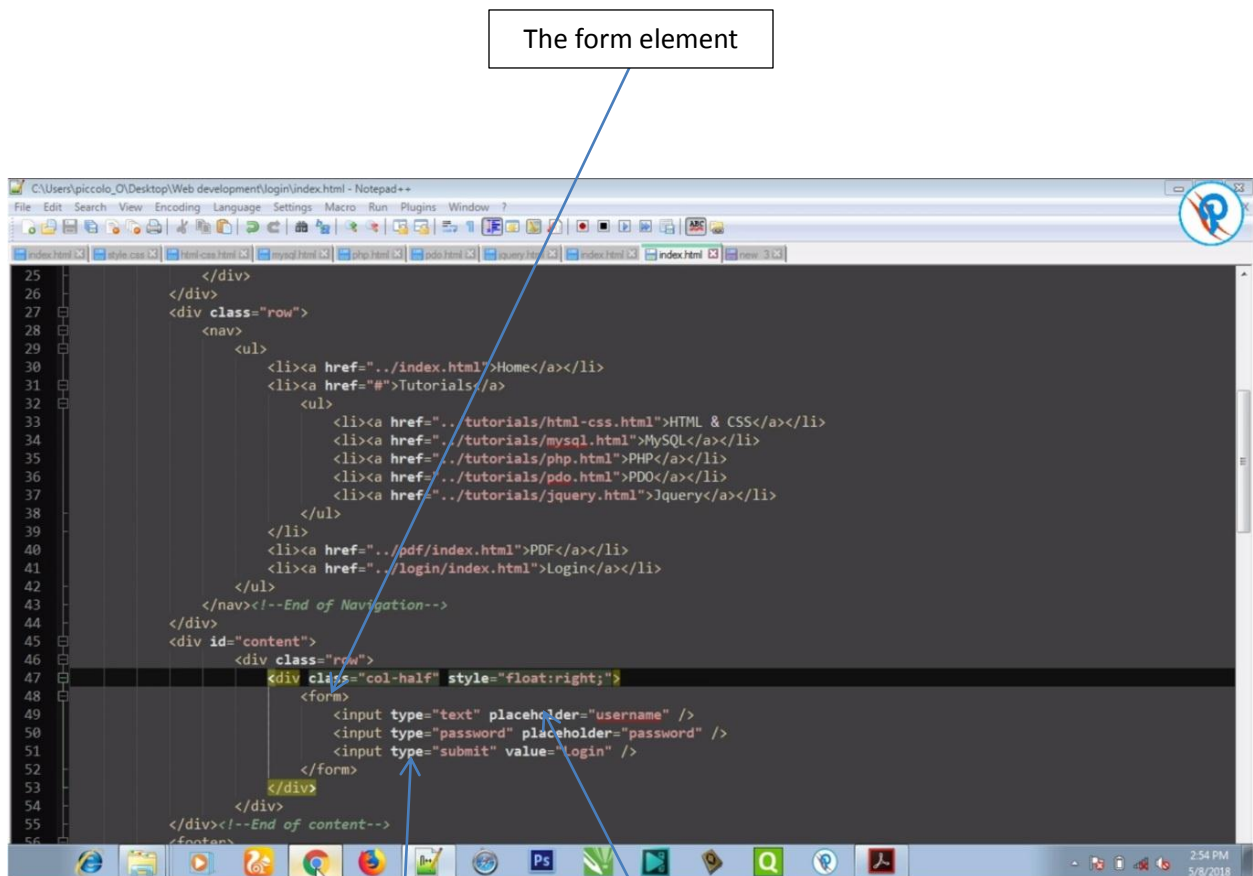

Below are some of the examples of the type attributes value:

- 1) text: When the type attribute has a value of text, it creates a single line text input.
- 2) password: When the type attribute has a value of password, it creates a text box that acts just like a single-line text input, except the characters are blocked out.
- 3) radio: Radio buttons allow users to pick just one of a number of options.
- 4) checkbox: Checkboxes allow users to select (and unselect) one or more options in answer to a question.
- 5) file: if you want to allow users to upload a file (for example an image, video, word document or a PDF).
- 6) submit: The submit button is used to send a form to the server.
- 7) image: If you want to use an image for the submit button, you can give the type attribute a value of image. Example:

```
<input type="image" src="../images/submit.png" width="100px;" height="70px;" />
```

NOTE: You can research more on the type attribute values.

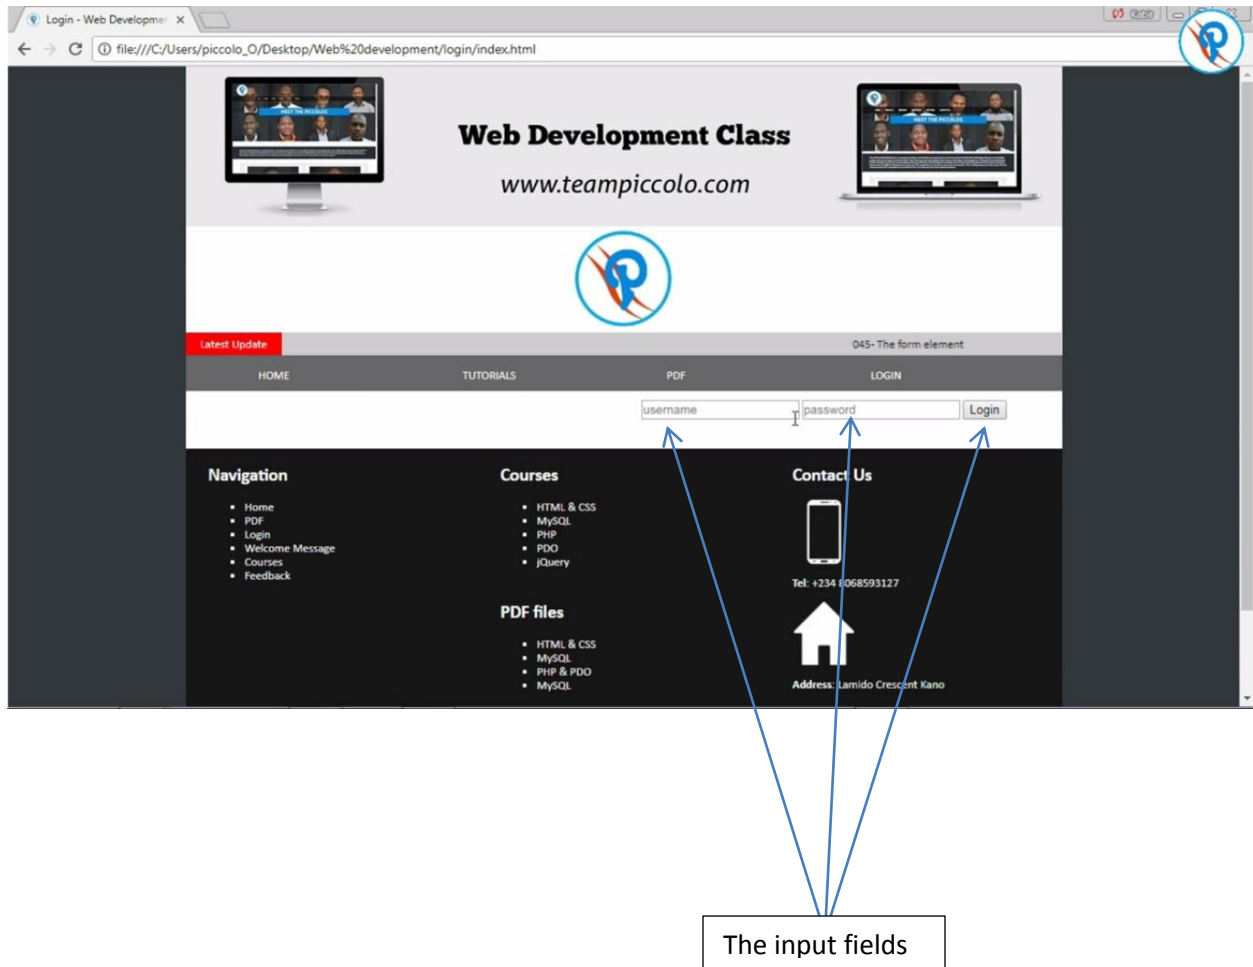

045- The <form> element

The **type** attribute with a value of "submit"

The **placeholder** attribute is used to specifies a short hint that describes the expected value of an input
